

Automation As a Service

- We see automation as a key enabler for agile-lean and dev-ops trends in software development while focusing on quality throughout the whole application lifecycle management
- We provide automation services from build and test automation to business process automation to deliver operational efficiencies and business effectiveness

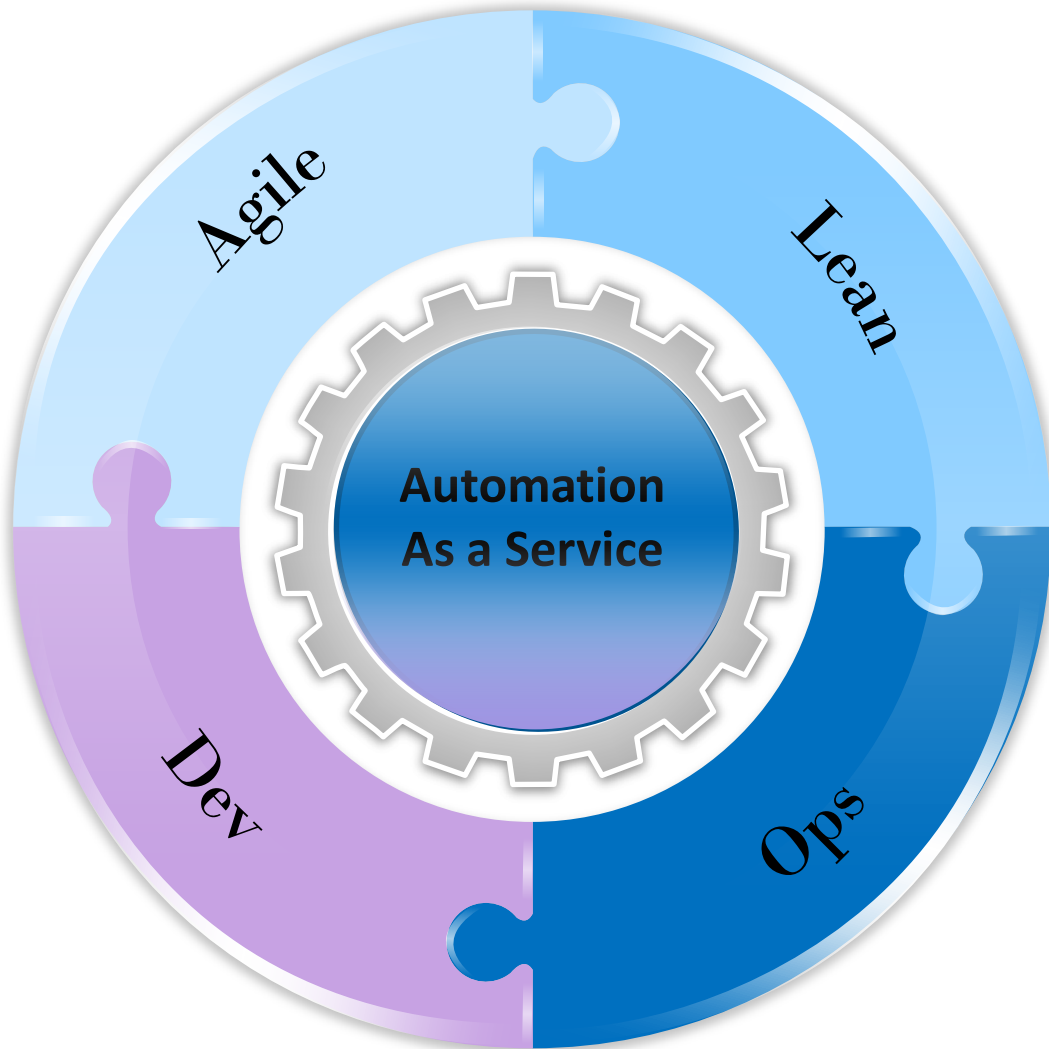

Agile

- We see automation as a key enabler for effective agile adoption in IT organizations
- Automation is critical when implementing TDD, BDD and CI agile practices
- Agile testing is based on test automation to enable short iterative and incremental cycles
- Automation enables the focus on quality throughout the whole application lifecycle management

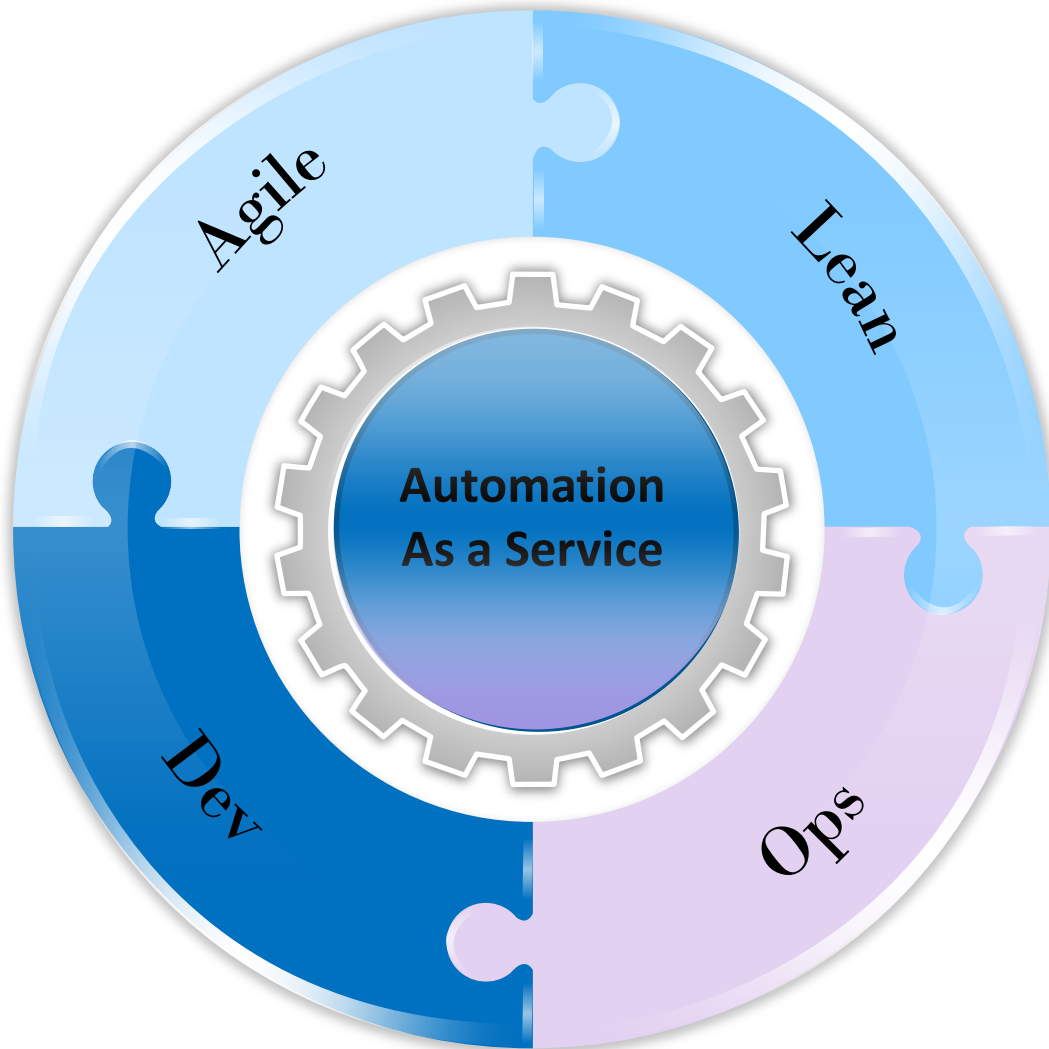

Lean

- We see automation as a key enabler for any lean software development
- Automation makes possible to implement and use lean principles of eliminating waste throughout the software development lifecycle while focusing on quality
- Automation enables to streamline and deliver added-value processes efficiently

Operations

- Automation plays a key role in the latest dev-ops trend in integrating development and operational activities based on automating deployment processes using build and test automation as well as continuous integration
- Continuous delivery into operations would not be possible without automation which then brings about operational efficiencies into the business as usual env

Development

- We see automation as a key enabler for effective and efficient software development
- Automation is at the core of any effective agile development and testing
- Our offering includes both bespoke automation tools as well as support for industry standard automation solutions including HP, IBM and Atlassian suite of products
